

PGCLOUD · CONSOLE DEMO

AI-native developer cloud — Istanbul

Screens captured from the running MVP: Next.js console → NestJS control plane → Temporal workflows → (fake) hypervisor driver. Nothing here is a mock-up; every state is produced by the real API.

- Sign in, create a server, watch it provision live, act on it
- One-click marketplace apps with declared variables and live pricing
- Billing: metering → hourly rating → TRY/USD, backups as % of plan
- English · Türkçe · العربية (RTL) · dark mode · API-first (/docs)

Working name “pgcloud”, region ist1, 2026-09-25

Email + password today; TOTP 2FA is mandatory for owners in the MVP plan. The console is just one client of the public API — the same login endpoint issues the session JWT the CLI will use.

NAME	STATUS	PUBLIC IP	SIZE	IMAGE	CREATED	ACTIONS
api-demo	provisioning	203.0.113.12	s-1vcpu-2gb	Debian 12	9/25/2026, 10:25:42 AM	
agent-1	active	203.0.113.10	s-1vcpu-1gb	Ubuntu 24.04 LTS	9/25/2026, 8:54:44 AM	Stop Reboot Delete
n8n-1	active	203.0.113.11	s-2vcpu-4gb	n8n on Ubuntu 24.04	9/25/2026, 8:51:49 AM	Stop Reboot Delete

"api-demo" was just created through the API (POST /v1/servers → 202). The list polls every 2 s while anything is transitioning: new → provisioning → active. Row actions appear only for valid transitions.

Servers

Create server

NAME	STATUS	PUBLIC IP	SIZE	IMAGE	CREATED	ACTIONS
api-demo	active	203.0.113.12	s-1vcpu-2gb	Debian 12	9/25/2026, 10:25:42 AM	Stop Reboot Delete
agent-1	active	203.0.113.10	s-1vcpu-1gb	Ubuntu 24.04 LTS	9/25/2026, 8:54:44 AM	Stop Reboot Delete
n8n-1	active	203.0.113.11	s-2vcpu-4gb	n8n on Ubuntu 24.04	9/25/2026, 8:51:49 AM	Stop Reboot Delete

About six seconds later (fake driver; 30–60 s on Proxmox) the server is active with a public IP from the ist1 block and a private IP on the tenant overlay. Stop / Reboot / Delete are enabled.

Deploy

≈ TRY 1,080.00/mo

Image / marketplace app → size → name and app variables. Sizes below the app's minimum are disabled; the price estimate updates live from /v1/pricing in the team currency (TRY here). Hourly = monthly ÷ 672, capped at monthly.

05 Marketplace

The 15 launch apps, grouped by category, each with its minimum size. "Deploy" pre-selects the app on the create form. Apps are images + cloud-init + declared variables, built with Packer from a Git repo.

 **Swagger**
Supported by SMARTBEAR

pgcloud API v1 OAS 3.0

The same API powers the console, CLI, Terraform, SDKs and AI agents. Canonical spec: `packages/openapi/openapi.yaml`

Every console action exists in the public API first. Swagger UI is generated from the running NestJS app; the canonical spec lives in `packages/openapi` and will generate the Go/Python/JS SDKs, CLI and Terraform provider.

What this demo proves — and what is next

Proven end-to-end	Auth → project → quota/spend/verification checks → durable workflow → placement → IP → VM → firewall → metering → rating. Idempotency keys, audit log, agent-safe tokens with spend caps and approval rules.
Console scope (MVP)	Servers list/create/actions, marketplace, billing, i18n (EN/TR/AR), dark mode. Deliberately minimal — the API is the product.
Next on the console	Server detail page (actions history, snapshots, firewall tab), SSH key + token management, project switcher, team members, invoices detail, verification flow.
Next on the platform	Real Proxmox node with the Go host agent, payment gateways (iyzico/PayTR/Stripe), e-Fatura provider, TOTP, rate limits, then phase 2: VPC, volumes, backups schedule, MCP server, CLI/SDKs/Terraform.
Open decisions	Brand/domain, Istanbul DC provider, own IP block vs leased, Netlen-benchmarked TRY price book.
